Financial Management Financial Management / MBAC 813

Chapter 4 Time Value of Money

Professor Ines Nel

© 2007 Thomson South-Western. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

Chapter goals

Students should be able to:

- Do time value of money calculations
 - Future value
 - Present value
 - Rate of return / Interest rate
 - Time
- for annuities, lump sums and unequal cash flows
- Make decisions base on time value of money

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

3

The role of financial markets

- Voluntary **transfer of wealth** between individuals via financial intermediates across time (FV and PV)
- Competition and financial costs
- Corporate perspective
 - Required return (cost of capital, opportunity cost)
- The chance to earn a return on invested funds means a Rand today is worth more than a Rand (or dollar, euro, pound, franc, or yen) in the future

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

4

Time lines show timing of cash flows (CF).

Tick marks at ends of periods, but CF_0 is today; CF_1 is the end of Period 1; CF_2 end of period 2 etc.

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

5

Time line for a R100 lump sum due at the end of Year 2.

6

9

Future Value

The value of a lump sum or stream of cash payments at a future point in time

$$FV_n = PV \times (1+r)^n$$

Future Value depends on:

- Interest Rate
- Number of Periods
- Compounding Interval

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

10

Calculating future value

Future values

Future values - the formula

In general terms the future value of a single amount invested is:

$$CF_0 \times (1+i)^n = FV_n$$

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

Solve $FV_n = PV(1+i)^n$

$$PV = \frac{FV_n}{(1+i)^n} \quad \text{therefore} \quad FV_n = PV (1+i)^n$$

Future value of €100 invested at 10% per year = 100×1.10^3
= €133.1

Present value of €133.1 discounted at 10% per year = $133.1 / 1.10^3$ = €100

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

Exercise - Calculate:
Future Value of \$100 (5 Years, 6% Interest)

The power of compounded interest

Source: Brigham & Gapenski

All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

17

Key points:

- The higher the **interest rate**, the higher the future value
- The longer the **period of time**, the higher the future value

Compounding: Is to find the **future value** of **present amount** invested at a given rate

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

18

Present Value

Today's value of a lump sum or stream of cash payments received at a future point in time

$$FV_n = PV \times (1 + r)^n$$

PV calculation is the inverse of future value calculation

$$PV = \frac{FV_n}{(1 + r)^n}$$

19

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

Present Value

Problem : Mr A wants to raise money to fund an Arts festival in 1 year's time.
How much are you willing to lend him if he offers you 20% of the net profits? Mr A estimates that he will earn €500,000

Time line :

0 (now)	year end 1
Invest ?	$0.20 \times €500,000 = €100,000$

0 (now)	year end 1
Invest ?	€ 100,000
$\times (1 + 0.25)$ $\text{Invest?} \times 1.25 = €100,000$ $\text{Invest?} = €100,000 / 1.25$ $= €80,000$	

Thoughts €100,000 is only an **expected** value. This is a very risky operation
It could be a flop and earn far less, it could be a huge success and earn far more.

Calculation : I want an expected return of 25% so...

So you would be prepared to lend € 80,000 and expect a return of

$$\frac{€100,000 - €80,000}{€80,000} = 0.25 \text{ or } 25\%$$

Language : "Invest?" is the **present value** of €100,000 **discounted** at 25%

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

Present values

$$PV = \frac{FV_n}{(1+r)^n}$$

Typical in investment type problems

24

Three Ways to Find FVs

- Step-by-step approach using time line
- Solve the equation - calculator (formula approach).
- Use a spreadsheet.

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

25

Finding the Time to reach goal

$$\begin{aligned}FV &= PV(1 + r)^n \\R2 &= R1(1 + 0.20)^n \\(1.2)^n &= R2/R1 = 2 \\n\text{LN}(1.2) &= \text{LN}(2) \\n &= \text{LN}(2)/\text{LN}(1.2) \\n &= 0.693/0.182 = 3.8.\end{aligned}$$

26
© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

Finding Interest Rate that will achieve goal

$$\begin{aligned}
 FV &= PV(1 + r)^n \\
 R2 &= R1(1 + r)^3 \\
 (2)^{(1/3)} &= (1 + r) \\
 1.2599 &= (1 + r) \\
 i &= 0.2599 = 25.99\%.
 \end{aligned}$$

27
© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

FV of a mixed (uneven) cash flow stream

Future value of an n -year mixed stream of cash flows (FV) can be expressed as

$$\begin{aligned}
 FV &= CF_1 \times (1 + r)^{n-1} + CF_2 \times (1 + r)^{n-2} + \dots \\
 &\quad + CF_n \times (1 + r)^{n-n}
 \end{aligned}$$

or

$$FV = \sum_{t=1}^n CF_t \times (1 + r)^{n-t}$$

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

28

Exercise: Find the FV of the *mixed (uneven)* cash flow stream below invested at 9% interest

Present values of irregular cash flows

- Present value is additive you can add the present value of expected cash flows from different future time periods
- For example, a project offers *annual* cash flows of €100,150,200,250 and 250 what is the present value given an interest rate of 25%?

$$463 = \frac{100}{(1.25)^1} + \frac{150}{(1.25)^2} + \frac{200}{(1.25)^3} + \frac{250}{(1.25)^4} + \frac{250}{(1.25)^5}$$

- An investment of €463 yields a return of 25%

What is an annuity

Stream of equal cash flows at regular intervals

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

31

Annuities

Common in finance regular payments and repayments
e.g. €100 per month for 5 years as repayment for a loan charged at 1% a month.

Present value	month 1	month 1	month 1	Month 1...	Month 60
	100	100	100	100	100
4495.5	$100/1.01 = 99$	$100/1.01^2 = 98$	$100/1.01^2 = 97$	$100/1.01^2 = 96$	$100/1.01^{60} = 55$

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

32

FV of Annuities - Formulas

FV of an ordinary annuity:

$$FV = PMT \times \left\{ \frac{[(1 + r)^n - 1]}{r} \right\}$$

FV of an annuity due:

$$FV(\text{annuity due}) = PMT \times \left\{ \frac{[(1 + r)^n - 1]}{r} \right\} \times (1 + r)$$

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

33

Exercise: calculate the FV of an *ordinary annuity* of \$1,000 at 7% interest annually for 5 years

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

34

Exercise: Calculate the Present value of ordinary annuity (Payment \$7000, 5 Years, 8% Interest Rate)

permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

35

Calculate the FV of an *annuity due* of \$1,000 at 7% annual interest for 5 years

permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

Annuities the formula

Present value of an n year annuity of €P = $P \times \left(\frac{1}{i} - \frac{1}{i \times (1+i)^n} \right)$

The difference between a
perpetuity starting now

and a perpetuity
starting in n periods
time

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

37

Annuities the formula

Present value of an n year annuity of €P = $P \times \left(\frac{1}{i} - \frac{1}{i \times (1+i)^n} \right)$

- $A_{i,n}$ = Annuity £1 for n periods an interest rate of i
- $i = 0.01$ and $n = 60$ $A_{0.01,60} = (100 - 55.045) = 44.955$.
- Annuity of €100 has a present value of $100 \times 44.955 = €4,495.5$

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

38

What's the FV of a 5-year monthly annuity of \$100 at 1%/ month?

Previously calculated that the present value is €4,495.5

Therefore... €4,495.5 x 1.01⁶⁰ = €8,166.96

Can use the formulae to move cash flows around in time

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

39

Present value of a **perpetuity**

$$PV = PMT \times \frac{1}{r} = \frac{PMT}{r}$$

Present value of a **growing perpetuity**

$$PV = \frac{CF_1}{r - g} \quad r > g$$

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

Present value of a growing perpetuity

Growing Perpetuity:

$CF_1 = \$1,000$; $r = 7\%$ per year; $g = 2\%$ per year

$$PV = \frac{CF_1}{r - g} = \frac{\$1,000}{0.07 - 0.02} = \$20,000$$

Source: Adjusted from Megginson

All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

41

Compounding more often than annually

- Semiannually
- Quarterly
- Continuous
- The more frequently interest compounds, the greater the amount of money that accumulates.

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

42

Compounding Intervals

General equation where:

m = number of payments per period; and
n = number of periods

$$FV_n = PV \times \left(1 + \frac{r}{m}\right)^{m \times n}$$

- For Semiannual Compounding m = 2
- For Quarterly Compounding m = 4
- For Monthly Compounding m = 12
- For continuous Compounding m = 365 / 360

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

43

Compounding more frequently than annually PV R125000 and interest rate 5%

Semi-annual Compounding

$$FV_2 = R125000 \times \left(1 + \frac{0.05}{2}\right)^{2 \times 2} = R137976.61$$

Quarterly Compounding

$$FV_2 = R125000 \times \left(1 + \frac{0.05}{4}\right)^{4 \times 2} = R138060.76$$

44

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

Nominal rate

- Stated in contracts, and quoted by banks and brokers.
- The rate is per year unless stated otherwise
- Examples:
 - 8% Quarterly = $1.08^4 - 1 = 1.36 - 1 = 36\%$ AER
 - AER = Annual Equivalent rate or EAR equivalent effective rate
 - Daily interest (365 days)
 - Simple $36\% / 365 = 0.09863\%$
 - Actuarial $(1+x)^{365} = 36\%$ so $1.36^{1/365} - 1 = x = 0.0843\%$

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

45

Effective annual rate

$$EAR = \left(1 + \frac{r}{m} \right)^m - 1$$

$$EAR_{\text{Annual}} = 12\%.$$

$$EAR_Q = (1 + 0.12/4)^4 - 1 = 12.55\%.$$

$$EAR_M = (1 + 0.12/12)^{12} - 1 = 12.68\%.$$

$$EAR_{D(365)} = (1 + 0.12/365)^{365} - 1 = 12.75\%.$$

Exercise FV of PV R100 for 1 year interest 5%

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

To solve actuarial problems

- Find the right formula and solve for the missing value. Solve for values (how much) by equation and for n and i with a spreadsheet (trial and error)
- Mr Y offers a $\frac{1}{2}$ share in a painting to be sold in 2 years' time for an estimated €500,000. You want a 25% return how much would you offer *now* for the $\frac{1}{2}$ share?
- $250,000/1.25^2 = x$ therefore $x = €160,000$

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

To solve actuarial problems

- continued
- You want to save €150 a month to buy a car costing €5,000. How long will you have to save if interest rates are 0.5% a month

present value of an annuity... moved to a future point in time (n)

$$\left(\frac{1}{i} - \frac{1}{i \times (1+i)^n} \right) \times (1+i)^n = 5,000$$

- Solution:
 - We know $i = 0.5\%$ we do not know n
 - Solve using a spreadsheet (31 months)

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

Spot rates

- Spot rates = invest now for a given “term” (i.e. time period) at this annual rate...
- e.g. Barclays flexible bond rates Nov 2015
1yr 1.1%; 2yr 1.2%; 3yr 1.8%

Investment for varying spot rates and their terms	End of term value
£1,000 for 1 year spot = $£1,000 \times 1.011 =$	£1,011
£1,000 for 2 year spot = $£1,000 \times 1.012^2 =$	£1,024
£1,000 for 3 year spot = $£1,000 \times 1.018^3 =$	£1,055

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

Forward rates

- Forward rates = annual rate to invest in x years' time

Investment for varying <i>spot</i> rates & terms	end of term value	Implied <i>annual</i> forward rates
£1,000 for 1 year spot 1.1%	£1,011	Rate from now so only a spot rate of 1.1%
£1,000 for 2 year spot @1.2%	£1,024	1 year forward rate: $1024/1011 - 1 = 1.29\%$
£1,000 for 3 year spot @1.8%	£1,055	2 year forward rate: $1,055/1,024 - 1 = 3.01\%$
Check $£1,000 \times 1.011 \times 1.0129 \times 1.0301 = £1055$		

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

Spot Yield curve on U.K. Government bonds

source: Bank of England website

Time value of money

- Values time and risk
- The main model for borrowing and lending calculations (e.g. bonds)
- The main valuation model in finance for projects and risky investments (e.g. shares) but not the only model

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

Amortization

Construct an amortization schedule for a R1,000, 10% annual rate loan with 3 equal payments.

53
© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

Step 1: Find the required payments.

54
© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

Step 2: Find interest charge for Year 1.

$$\begin{aligned} \text{INT}_t &= \text{Beg bal}_t (r) \\ \text{INT}_1 &= \text{R1,000}(0.10) = \boxed{\text{R100.}} \end{aligned}$$

Step 3: Find repayment of principal in Year 1.

$$\begin{aligned} \text{Capital payment} &= \text{PMT} - \text{INT} \\ &= \text{R402.11} - \text{R100} \\ &= \boxed{\text{R302.11}} \end{aligned}$$

55
© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

Step 4: Find ending balance after Year 1.

$$\begin{aligned} \text{End bal} &= \text{Beg balance} - \text{Capital Payment} \\ &= \text{R1,000} - \text{R302.11} = \text{R697.89.} \end{aligned}$$

Repeat these steps for Years 2 and 3 to complete the amortization table.

56
© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

Payment Schedule

Yr	Beg bal	Pmt	Int	Prin pmt	End bal
1	R1,000	R402	R100	R302	R698
2	698	402	70	332	366
3	366	402	37	366	0
TOT		<u>1,206.34</u>	<u>206.34</u>	<u>1,000</u>	

Interest declines. Tax implications.

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

57

Implied interest or growth rates

- Lump sums: the interest or growth rate of a single cash flow over time

$$(1 + r)^n = \frac{FV}{PV}$$

- Annuities: interest rate associated with an annuity

© 2016 Cengage Learning EMEA. All Rights Reserved. May not be copied, scanned, or duplicated, in whole or in part, except for use as permitted in a license distributed with a certain product or service or otherwise on a password-protected website for classroom use.

58

Have we achieved our goals

Are we able to:

- Do time value of money calculations
 - Future value
 - Present value
 - Rate of return / Interest rate
 - Time
 - for annuities, lump sums and unequal cash flows
- Take decisions base on time value of money

59

Small Case

Calculate:

The value of R1500 invested today for 5 years if the rate of return is 15% per year

= R3017.03

PV = -R1500 FV = ? N = 5 PMT = R0 I = 15%

What would the value of R1500 be over 5 years if invested one year from today if the rate of return is 15% per year

= R2623.50

PV = -R1500 FV = ? N = 4 PMT = R0 I = 15%

60

Small Case

Calculate:

The value of R1500 invested today for 5 years if the rate of return is 15% per year and compounded semi-annually

$$= \text{R3091.54}$$

$$\text{PV} = -\text{R1500} \quad \text{FV} = ? \quad \text{N} = 10 \quad \text{PMT} = \text{R0} \quad \text{I} = 7.5\%$$

The value of R1500 invested one year from today for 5 years if the rate of return is 15% per year and compounded semi-annually

$$= \text{R2675.21}$$

$$\text{PV} = -\text{R1500} \quad \text{FV} = ? \quad \text{N} = 8 \quad \text{PMT} = \text{R0} \quad \text{I} = 7.5\%$$

61

Small Case

Calculate:

If you want to have R15000 five years from today how much do you need to invest today if you can earn 10% per year

$$= \text{R9313.81}$$

$$\text{PV} = ? \quad \text{FV} = \text{R15000} \quad \text{N} = 5 \quad \text{PMT} = \text{R0} \quad \text{I} = 10\%$$

If you want to have R15000 five years from today how much do you need to invest at the end of each year if you can earn 10% per year

$$= \text{R10245.20}$$

$$\text{PV} = ? \quad \text{FV} = \text{R15000} \quad \text{N} = 4 \quad \text{PMT} = \text{R0} \quad \text{I} = 10\%$$

62

Have we achieved our goals

Calculate:

If you want to have R15000 five years from today how much do you need to invest today if you can earn 10% per year compounded quarterly

$$PV = ? \quad FV = R15000 \quad N = 20 \quad PMT = 0 \quad I = 2.5\%$$

If you want to have R15000 five years from today how much do you need to invest at the end of each year if you can earn 10% per year compounded quarterly

$$PV = ? \quad FV = R15000 \quad N = 16 \quad PMT = 0 \quad I = 2.5\%$$

63

Small Case

Calculate:

If you have R15000 today and you want to have R45000 in five years what rate of return do you need to earn

$$PV = -R15000 \quad FV = R45000 \quad N = 5 \quad PMT = 0 \quad I = ?$$

If you can earn a rate of return of 15% and you have R15000 today how long will it be before you have R45000

$$PV = -R15000 \quad FV = R45000 \quad N = ? \quad PMT = 0 \quad I = 15\%$$

64

Small Case

Construct an amortization schedule for a **R2,000, 12%** annual rate loan with **5** equal payments.

Year	Begin	PMT	Interest	Principle	End
1	R 2 000	R 554	R 240	R 314	R 1 686
2	R 1 686	R 554	R 202	R 352	R 1 334
3	R 1 334	R 554	R 160	R 394	R 940
4	R 940	R 554	R 113	R 441	R 499
5	R 499	R 554	R 60	R 494	R 5

65

Class Case Questions

Based on the financial information available calculate the following:

- Growth in sales for the past five years.
- Growth in total fix asset value over the past five years.
- Growth in total current asset value over the past five years.
- Growth in total asset value over the past five years.
- Growth in cost of sales over the past five years.
- Growth in fixed /operating cost over the past five years.
- Calculate the operating profit margin for the past five years.

Based on the above what is your assessment of the management of operations of the organization? - Compare the relative growth between related variables i.e. Sales to Asset growth

Note regarding the above to be added to this slide range on Efundi later
